

# Contents of the *Almagest*<sup>1</sup>

	page
BOOK I	
1. Preface	35
2. On the order of the theorems	37
3. That the heavens move like a sphere	38
4. That the earth, too, taken as a whole, is sensibly spherical	40
5. That the earth is in the middle of the heavens	41
6. That the earth has the ratio of a point to the heavens	43
7. That the earth does not have any motion from place to place, either	43
8. That there are two different primary motions in the heavens	45
9. On the individual concepts	47
10. On the size of chords	48
11. Table of chords	57
12. On the arc between the solstices	61
13. Preliminaries for spherical proofs	64
14. On the arcs between the equator [and the ecliptic]	69
15. Table of inclination	72
16. On rising-times at <i>sphaera recta</i>	71
BOOK II	
1. On the general location of our part of the inhabited world	75
2. Given the length of the longest day, how to find the arcs of the horizon cut off between the equator and the ecliptic	76
3. If the same quantities be given, how to find the elevation of the pole, and <i>vice versa</i>	77
4. How to compute for what regions, when, and how often the sun reaches the zenith	80
5. How one can derive the ratios of the gnomon to the equinoctial and solstitial noon shadows from the above-mentioned quantities	80
6. Exposition of the special characteristics, parallel by parallel	82

<sup>1</sup> These lists of the chapter headings are found in the mss. at the beginning of each book preceded by the words 'The following are the contents of Book *n* of Ptolemy's mathematical treatise'. I believe that the division into chapters and the chapter headings are later additions (see Introduction p. 5).

	page
7. On simultaneous risings of arcs of the ecliptic and equator at <i>sphaera obliqua</i>	90
8. Layout of the tables of rising-times from parallel to parallel <sup>2</sup>	100
9. On the particular features which follow from the rising-times	99
10. On the angles between the ecliptic and the meridian	105
11. On the angles between the ecliptic and the horizon	110
12. On the angles and arcs formed with the same circle [the ecliptic] by a circle drawn through the poles of the horizon	114
13. Layout of the proposed angles and arcs, parallel by parallel	122

## BOOK III

1. On the length of the year	131
2. Layout of the tables of the mean motions of the sun	142
3. On the hypotheses for uniform circular motion	141
4. On the apparent anomaly of the sun	153
5. On the construction of a table for individual subdivisions of the anomaly	157
6. Table of the sun's anomaly	167
7. On the epoch of the sun's mean motion	166
8. On the calculation of the solar position	169
9. On the inequality in the [solar] days	169

## BOOK IV

1. The kind of observations which one must use to examine lunar phenomena	173
2. On the periods of the moon	174
3. On the individual mean motions of the moon	179
4. Layout of the tables comprising the mean positions of the moon	182
5. That in the simple hypothesis of the moon, too, the same phenomena are produced by both eccentric and epicyclic hypotheses	180
6. Demonstration of the first, simple anomaly of the moon	190
7. On the correction of the mean positions of the moon in longitude and anomaly	204
8. On the epoch of the mean motions of the moon in longitude and anomaly	204
9. On the correction of the mean positions in latitude of the moon, and their epoch	205

<sup>2</sup> Most mss., followed by Heiberg, read at H86,20 κανονίων τῶν κατὰ δεκαμοίριαν παράλληλον, which is untranslatable. I read with D κανονίων τῶν κατὰ παράλληλον. Someone who compared the text at II 8 (H 134,1), κανόνιον τῶν κατὰ δεκαμοίριαν ἀναφορῶν, imported δεκαμοίριαν here and tried to combine the two inconsistent descriptions.

	page
10. [Method of] calculation and table of the first, simple anomaly of the moon <sup>3</sup>	210
11. That the difference in the size of the lunar anomaly according to Hipparchus is due not to the different hypotheses employed, but to his calculations	211

BOOK V

1. On the construction of an 'astrolabe' instrument	217
2. On the hypothesis for the double anomaly of the moon	220
3. On the size of the moon's anomaly which is related to the sun	222
4. On the ratio of the eccentricity of the moon's circle	225
5. On the 'direction' of the moon's epicycle	226
6. How the true position of the moon can be calculated geometrically from the periodic motions	233
7. Construction of a table for the complete lunar anomaly	234
8. Table of the complete lunar anomaly	238
9. On the complete calculation of the moon's position	237
10. That the difference at the syzygies due to the moon's eccentricity is negligible	239
11. On the moon's parallaxes	243
12. On the construction of a parallactic instrument	244
13. Demonstration of the distances of the moon	247
14. On the ratio of the apparent diameters of sun, moon and shadow at the syzygies	251
15. On the distance of the sun, and other consequences of the demonstration of that	255
16. On the sizes of sun, moon and earth	257
17. On the individual parallaxes of sun and moon	258
18. Parallax table	265
19. On the determination of the parallaxes	264

BOOK VI

1. On conjunctions and oppositions of sun and moon	275
2. Construction of tables of mean syzygies	275
3. Layout of the tables	278
4. How to determine the mean and true syzygies	277
5. On the ecliptic limits of sun and moon	282
6. On the interval of months between eclipses	287
7. Construction of eclipse tables	294

<sup>3</sup> In the text the 'method of calculation' is explained at the end of ch. 9, and ch. 10 consists solely of the table. This variation is perhaps a remnant of a different chapter division. Cf. Introduction p. 5.

	page
8. Layout of the eclipse tables	306
9. Determination of lunar eclipses	305
10. Determination of solar eclipses	310
11. On the angles of inclination at eclipses	313
12. Display of diagrams for the inclinations	319
13. Determination of the inclinations	318

BOOK VII

1. That the fixed stars always maintain the same position relative to each other	321
2. That the sphere of the fixed stars, too, performs a rearward motion along the ecliptic	327
3. That the rearward motion of the sphere of the fixed stars, too, takes place about the poles of the ecliptic	329
4. On the method used to record [the positions of] the fixed stars	339
5. Tabular layout of the constellations in the northern hemisphere	341

BOOK VIII

1. Tabular layout of the constellations in the southern hemisphere	371
2. On the situation of the circle of the Milky Way	400
3. On the construction of a solid globe	404
4. On the configurations particular to the fixed stars	407
5. On simultaneous risings, culminations and settings of the fixed stars	410
6. On first and last visibilities of the fixed stars	413

BOOK IX

1. On the order of the spheres of sun, moon and the five planets	419
2. On our purpose in the hypotheses of the planets	420
3. On the periodic returns of the five planets	423
4. Tables of the mean motions in longitude and anomaly of the five planets	427
5. Preliminary notions [necessary] for the hypotheses of [the five planets]	426
6. On the type of and differences between the hypotheses	443
7. Demonstration of [the position of] the apogee of Mercury and of its displacement	449
8. That the planet Mercury, too, comes closest to the earth twice in one revolution	453
9. On the ratio and amount of its [Mercury's] anomalies	456
10. On the correction of its periodic motions	461
11. On the epoch of its periodic motions	467

page

BOOK X

1. Demonstration of [the position of] the apogee of the planet Venus	469
2. On the size of its epicycle	470
3. On the ratios of the eccentricities of the planet	472
4. On the correction of the periodic motions of the planet	474
5. On the epoch of its periodic motions	479
6. Preliminaries for the demonstrations concerning the other planets	480
7. Demonstration of the eccentricity and apogee [position] of Mars	484
8. Demonstration of the size of the epicycle of Mars	499
9. On the correction of the periodic motions of Mars	502
10. On the epoch of its periodic motions	505

BOOK XI

1. Demonstration of the eccentricity and apogee [position] of Jupiter	507
2. Demonstration of the size of its epicycle	520
3. On the correction of its periodic motions	522
4. On the epoch of its periodic motions	525
5. Demonstration of Saturn's eccentricity and [the position of] its apogee	525
6. Demonstration of the size of its epicycle	538
7. On the correction of its periodic motions	541
8. On the epoch of its periodic motions	543
9. How the true positions can be found geometrically from the periodic motions	544
10. Method of constructing tables for the anomalies	545
11. Layout of the tables for the determination of the positions in longitude of the five planets	549
12. On the computation of the longitude of the five planets	554

BOOK XII

1. On the preliminaries for the retrogradations	555
2. Demonstration of the retrogradations of Saturn	562
3. Demonstration of the retrogradations of Jupiter	569
4. Demonstration of the retrogradations of Mars	572
5. Demonstration of the retrogradations of Venus	575
6. Demonstration of the retrogradations of Mercury	578
7. Construction of a table for the stations	583
8. Layout of the table of the stations	588

page

9. Demonstration of the greatest elongations from the sun of Venus and Mercury	587
10. Layout of the table of the greatest elongations from the sun of Venus and Mercury	596

BOOK XIII

1. On the hypotheses for the positions in latitude of the five planets	597
2. On the type of the motions in inclination and slant according to the hypotheses	599
3. On the amount of the inclination and slant for each [planet]	601
4. Construction of the tables for the individual positions in latitude	605
5. Layout of the tables for the computations in latitude	632
6. Computation of the deviation in latitude for the five planets	635
7. On the first and last visibilities of the five planets	636
8. That the peculiar characteristics of the first and last visibilities of Venus and Mercury are also in accordance with the hypotheses	640
9. Method of determining the individual elongations from the sun at first and last visibilities	645
10. Layout of the tables comprising the first and last visibilities of the five planets	647
11. Epilogue of the treatise	647
