6.4. The title-page of Galileo's *Sidereus nuncius* (1610), with a summary of the discoveries announced in the work. Special prominence is given to the satellites of Jupiter, named for Galileo's patron, Cosimo de' Medici.

SIDEREAL MESSENGER

unfolding great and very wonderful sights
and displaying to the gaze of everyone,
but especially philosophers and astronomers,

the things that were observed by

GALILEO GALILEI,

Florentine patrician

and public mathematician of the University of Padua,

with the help of a spyglass lately devised by him,
about the face of the Moon, countless fixed stars,

the Milky Way, nebulous stars,

but especially about

four planets

flying around the star of Jupiter at unequal intervals

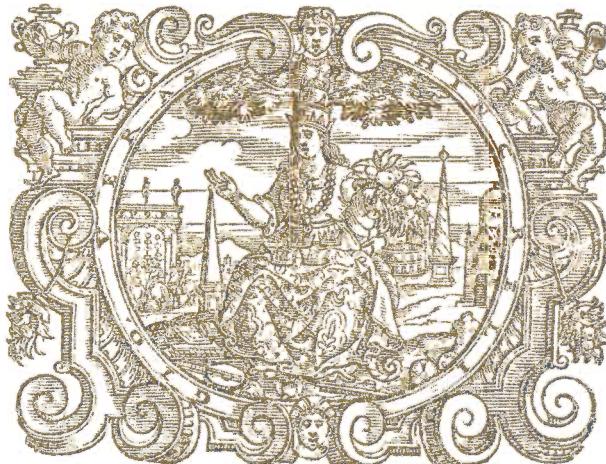

and periods with wonderful swiftness;

which, unknown by anyone until this day,

the first author detected recently

and decided to name

MEDICEAN STARS

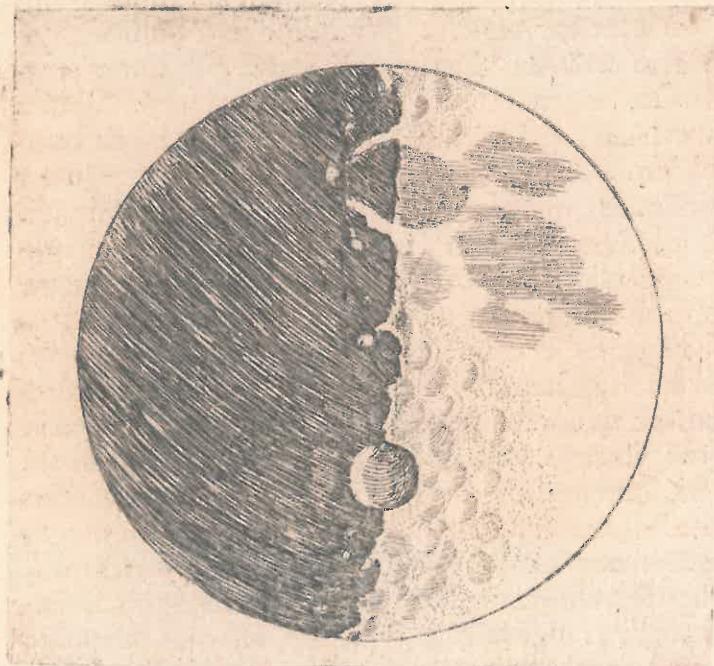

Venice, Thomas Baglioni, 1610

with permission and highest privilege

OBSERVAT. SIDEREAE

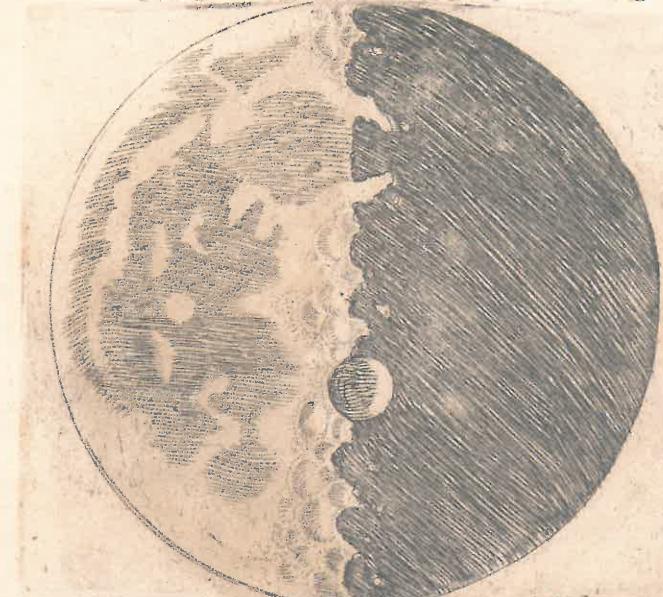

Etum daturam. Depressiores insuper in Luna cernuntur magnæ maculae, quam clariores plague; in illa enim tam crescente, quam decrescente semper in lucis tenebrarumque confinio, prominentे hincindè circa ipsas magnas maculas contermini partis lucidioris; veluti in describendis figuris obseruauimus; neque depressiores tantummodo sunt dictarum macularum termini, sed æquabiliores, nec rugis, aut asperitatibus interrupti. Lucidior verò pars maximè propè maculas eminet; adeò ut, & ante quadraturam primam, & in ipsa fermè secunda circa maculam quandam, superiorem, borealem nempè Lunę plagam occupantem valdè attollantur tam supra illam, quam infra ingentes quæda eminentia, veluti appositæ præseferunt delineationes.

Hec

RECENS HABITAE.

10

Hæc eadem macula ante secundam quadraturam nigroribus quibusdam terminis circumuallata conficitur; qui tanquam altissima montium inga ex parte Soli auersa obscuriores apparent, quæ verò Solem respiciunt lucidiores extant; cuius oppositum in cibitibus accidit, quarum pars Soli auersa splendens appetet, obscura verò, ac umbrosa, quæ ex parte Solis sita est. Imminuta deinde luminosa superficie, cum primum tota fermè dicta macula tenebris est obducta, clariora montium dorsa eminenter tenebras scandunt. Hanc duplarem apparentiam sequentes figuræ com: monstrant.
